This is a hyperlinked document, start with Background and follow the links to navigate

Background

Aminoglycosides are antimicrobials usually reserved for treatment of gram negative organisms not susceptible to other, less toxic antibiotic therapy. Aminoglycosides may very rarely be used in combination with other antimicrobials ("synergy") in select infections due to gram positive bacteria such as *Enterococcus spp*. infective endocarditis.

Aminoglycosides are associated with potentially serious adverse effects including ototoxicity (cochleo- and vestibulotoxicity), nephrotoxicity and neuromuscular blockade (in patients with myasthenia gravis).

Ototoxicity is exposure dependent, is usually irreversible and occurs in as many as 20-40% of patients on prolonged therapy.

Nephrotoxicity is dose and duration dependent, is usually reversible and occurs in ~15% of patients.

Short course (i.e.<3 days) empiric therapy is unlikely to cause significant ototoxicity or nephrotoxicity In most patients.

Definitions and Abbreviations

Extended Interval Dosing	also referred to as "once daily dosing", this refers to a high-dose, less frequent administration of aminoglycoside to optimize bacterial killing and reduce nephrotoxicity
Traditional Dosing	also referred to as "multiple daily dosing", this refers to smaller, more frequent doses of aminoglycosides (usually twice to thrice daily)
Empiric Therapy	antimicrobials given before the causative organisms is isolated
Targeted Therapy	antimicrobials given after isolation of a causative organism
Peak Level	An aminoglycoside level drawn approximately 30 minutes AFTER the end of an aminoglycoside dose
Trough Level	An aminoglycoside blood level drawn immediately BEFORE the next scheduled aminoglycoside dose
Random Level	An aminoglycoside level drawn without regard to the dosing interval, peak or trough levels
CrCl	Creatinine Clearance (estimated by the Cockcroft-Gault equation)
IHD	Intermittent Hemodialysis
PD	Peritoneal Dialysis
CRRT	Continuous Renal Replacement Therapy
SLED	Sustained Low-Efficiency Dialysis

.

Dosing recommendations in this document refer to the intravenous (IV) route of administration

For patients on **peritoneal dialysis (PD) with peritonitis**, the intraperitoneal (IP) route is preferred.

For the management of PD peritonitis and IP aminoglycoside dosing recommendations, please refer to the UHN Division of Nephrology House Staff/NP guidebook on the Nephrology Home Page and consult Nephrology

What you need to know…

1. **Contraindications**
   a. Allergy to any aminoglycoside or components
   b. Myasthenia gravis
   c. Known genetic predisposition to aminoglycoside ototoxicity (i.e. specific mitochondrial mutations (ex. m. 1555A>G mutation)

2. **Comorbidity** (reasons to avoid extended interval dosing)
   a. Renal impairment or dialysis
   b. Ascites / Cirrhosis
   c. Pregnancy
   d. Large burn area (>20% BSA)
   e. Cystic fibrosis

3. **Anthropometrics**
   a. Total (Actual) Body Weight (TBW)
   b. Height
   c. Ideal Body Weight (IBW, Devine equation)
      i. Males: 50 kg + (2.3 x height per inch > 60 inches)
      ii. Females: 45.5 kg + (2.3 x height per inch > 60 inches)
   d. %IBW: (Actual Body Weight (kg) – Ideal Body Weight (kg))/Ideal Body Weight (kg)

4. **Kidney Function**
   a. Creatinine Clearance (using Cockcroft-Gault equation):
      i. Males: [(140-age) x ideal body weight]/ serum creatinine (mmol/L) x 1.2
      ii. Female: [(140-age) x ideal body weight]/ serum creatinine (mmol/L) x 1.2 x 0.85
      (Note: while other equations have been proposed and may be better reflective of renal function, Cockcroft-Gault continues to be the standard by which aminoglycosides are dosed)
   b. Urine output: if possible, gather information about current and past urine output to estimate stability of renal function

5. **Indication/Antimicrobial**
   a. Empiric or targeted treatment of infections due to gram negative bacteria (including obstetrics and gynecologic infections)
      i. Gentamicin/Tobramycin
      ii. Amikacin
   b. Treatment of infections due to non-tuberculous *Mycobacterium spp.*
      i. Amikacin
   c. Synergy for infections due to gram positive bacteria
      i. Gentamicin

-

Tobramycin/Gentamicin for treatment of infections due to gram negative bacteria

What you need to do…

1. **Determine dosing weight**

If patient is:	Then use:
Less than ideal body weight	Total (Actual) Body Weight (TBW)
100 to 130% of ideal body weight	Ideal body weight (IBW)
>130% of ideal body weight	Adjusted body weight (AdjBW) AdjBW=IBW + 0.4(TBW – IBW)

2. **Choose a situation/dosing strategy**
   a. Critically ill patients
   b. Non-critically ill patients with cystic fibrosis
   c. Other non-critically ill patients
      i. Extended Interval Dosing (choose ***UNLESS*** any of the following)
         (1) Renal impairment (CrCL<20 ml/min)
         (2) Ascites / Cirrhosis
         (3) Pregnancy
         (4) Large burn area (>20% BSA)
      ii. Traditional Dosing (if unable to use Extended Interval Dosing)

Tobramycin/Gentamicin in critically ill patients for treatment of infections due to gram negative bacteria

In critically ill patient's ≤130% IBW, use total body weight dosing to account for increased Vd. For patients >130% IBW, continue to use adjusted body weight.

Patients with renal dysfunction along with changes to volume of distribution often have significantly altered pharmacokinetic parameters. Frequent monitoring of urine output, serum creatinine and aminoglycosides are suggested.

Note that not all patients in the ICU will require this approach. In patients who are stable and not in a profound vasodilatory state, consider using a more routine dosing approach as outlined elsewhere in this document.

Initial Dose (regardless of renal function or dialysis timing)

Indication	Dose
Upper urinary tract infection, intra-abdominal infection, febrile neutropenia	5 mg/kg
Pneumonia, Septic Shock NYD	7 mg/kg
Patients with cystic fibrosis	10 mg/kg

(note: round to nearest 20mg increment)

Maintenance Dose Frequency

- CrCl > 60 ml/min: q24h
- CrCl 40-59 ml/min: q36h
- CrCl 20-39 ml/min, SLED, IHD or CRRT: q48h (ideally administered pre-dialysis) (NOTE: clearance between different patients and dialysis modalities is highly variable, dose adjustment by level and type/frequency of dialysis is essential)
- CrCl <20 ml/min: adjust dose by level

Monitoring

Most patients using empiric therapy for the coverage of gram negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

Trough only monitoring is acceptable for extended interval dosing. If dose reduction is required, peak monitoring should be done (refer to traditional dosing).

Therapeutic Drug Monitoring (TDM)

Renal Function/Dialysis	**Trough level timing**	**Re-dose if trough…**
CrCL > 60 ml/min	Prior to 3rd dose	<1 mg/L
CrCl ≤ 60 ml/min	Prior to 2nd dose	<1 mg/L
intermittent SLED/IHD	Prior to next scheduled dialysis session	< 2 mg/L
CRRT or continuous SLED	24 hours after 1st dose	< 1 mg/L

Tobramycin/Gentamicin extended interval dosing for treatment of infections due to gram negative bacteria

Dose (note: round to nearest 20mg increment)

Indication	Dose
Cystitis	3 mg/kg
Upper urinary tract infection, intra-abdominal infection, febrile neutropenia	5 mg/kg
Pneumonia	7 mg/kg

Frequency

- CrCl ≥ 60 ml/min: q24h
- CrCl 40 – 59 ml/min: q36h
- CrCl 20 – 39 ml/min/ q48h
- CrCl <20 ml/min use Traditional Dosing Strategy

Monitoring

Most patients using empiric therapy for the coverage of gram-negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

Trough Level Timing: <30 minutes before next dose

1. **Serum creatinine** at baseline and three times weekly while on therapy
2. **TDM**
   - CrCl ≥ 60 ml/min: pre-dose level 30 minutes before the 3rd dose
   - CrCl < 60 ml min: pre-dose level 30 minutes before the 2nd dose

Target

- Trough < 1 mg/L (ideally undetectable)

Tobramycin/Gentamicin traditional dosing for infections due to gram negative bacteria

Dose (note: round to nearest 20mg increment)

CrCl ≥ 20ml/min	1.7 mg/kg
IHD	2mg/kg load, then 1mg/kg post IHD
PD	1.7 mg/kg (if using for PD peritonitis, see nephrology PD guideline)
CRRT	Suggest extended interval dosing
SLED	1.7 mg/kg For durations of SLED longer than 8-12h, suggest extended interval dosing.

Frequency

- CrCl > 60 ml/min: q8h
- CrCl 40-60 ml/min: q12h
- CrCl 20-39 ml/min: q24h
- CrCl <20 ml/min: dose by level

Dialysis

- IHD: post-IHD (after initial load)
- PD: dose by level
- CRRT: Suggest extended interval dosing
- SLED: generally, q24h (see dosing)

Monitoring

Most patients using empiric therapy for the coverage of gram-negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

1. **Serum creatinine** at baseline and three times weekly while on therapy
2. **TDM**
   - CrCl >60 ml/min: peak post-3rd dose, trough pre-4th dose
   - CrCl 20 – 59 ml/min: peak post 2nd dose, trough pre-3rd dose
   - CrCl <20 ml/min: peak post 2nd dose, trough before each dose

   Dialysis
   - IHD: trough pre-IHD before next IHD session
   - PD: peak post 2nd dose, trough before each dose
   - CRRT: peak after 2nd dose, trough pre-3rd dose
   - SLED: peak after 2nd dose, trough pre-3rd dose

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

Target (non-IHD)

- Severe infection (ex. pneumonia): peak 8-10 mg/L, trough 1-2 mg/L
- Other infections: peak 6-8 mg/L, trough 1-2 mg/L
- Cystitis: peak 4-6 mg/L, trough 1-2 mg/L

Target (patients on IHD)

- Pre-dialysis levels should generally be between 1-2 mg/L, but may be higher in more severe infections, consult a clinical pharmacist for information
- Post-dialysis levels are not typically done

Amikacin for infections due to gram negative bacteria

What you need to do…

1. **Determine dosing weight**

If patient is:	Then use:
Less than ideal body weight	Total (Actual) Body Weight (TBW)
100 to 130% of ideal body weight	Ideal body weight (IBW)
>130% of ideal body weight	Adjusted body weight (AdjBW) AdjBW=IBW + 0.4(TBW – IBW)

2. **Choose a situation/dosing strategy**
   a. Critically ill patients (including those with cystic fibrosis)
   b. Non-critically ill patients with cystic fibrosis
   c. Other non-critically ill patients
      i. Extended Interval Dosing (choose ***UNLESS*** any of the following)
         (1) Renal impairment (CrCL<20 ml/min) or dialysis
         (2) Ascites / Cirrhosis
         (3) Pregnancy
         (4) Large burn area (>20% BSA)
      ii. Traditional Dosing (if unable to use Extended Interval Dosing)

Amikacin in <u>critically ill patients</u> for treatment of infections due to gram negative bacteria

In critically ill patient's ≤130% IBW, use total body weight dosing to account for increased Vd. For patients >130% IBW, continue to use adjusted body weight.

Patients with renal dysfunction along with changes to volume of distribution often have significantly altered pharmacokinetic parameters. Frequent monitoring of urine output, serum creatinine and aminoglycosides are suggested.

Note that not all patients in the ICU will require this approach. In patients who are stable and not in a profound vasodilatory state, consider using a more routine dosing approach as outlined elsewhere in this document.

Initial Dose (regardless of renal function or dialysis timing)

Indication	Dose
Upper urinary tract infection, intra-abdominal infection, febrile neutropenia	15 mg/kg
Pneumonia, Septic Shock	25 mg/kg
Patients wth cystic fibrosis	35 mg/kg

(Note: round to the nearest 20mg increment

Frequency

- CrCl > 60 ml/min: q24h
- CrCl 40-59 ml/min: q36h
- CrCl 20-39 ml/min, SLED, IHD and CRRT: q48h (adjust dose by level) (NOTE: clearance between different patients and dialysis modalities is highly variable, dose adjustment by level and type/frequency of dialysis is essential)
- CrCl <20 ml/min: adjust dose by level

Monitoring

Most patients using empiric therapy for the coverage of gram-negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

Trough Level Timing: <30 minutes BEFORE next dose

Trough only monitoring is acceptable for extended interval dosing. If dose reduction is required, peak monitoring should be done (refer to traditional dosing).

1. **Serum creatinine** at baseline and three times weekly while on therapy
2. **TDM**

Renal Function/Dialysis	Trough level timing	Re-dose if trough…
CrCL > 60 ml/min	Prior to 3rd dose	<2.3 mg/L
CrCl ≤ 60 ml/min	Prior to 2nd dose	<2.3 mg/L
intermittent SLED/IHD	Prior to next scheduled dialysis session	< 4-8 mg/L
CRRT or continuous SLED	24 hours after 1st dose	< 2.3 mg/L

Amikacin extended interval dosing for infections due to gram negative bacteria

Dose (Note: round dose to nearest 50 mg increment)

- 15 mg/kg

Frequency

- CrCl ≥ 60 ml/min: q24h
- CrCl 40 - 59 ml/min: q36h
- CrCl 20 – 39 ml/min: q48h
- CrCl <20 ml/min use traditional dosing strategy

Monitoring

Most patients using empiric therapy for the coverage of gram-negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

Trough Level Timing: <30 minutes BEFORE next dose

1. **Serum Creatinine** at baseline and three times weekly while on aminoglycoside therapy
2. **TDM**
   - CrCl > 60 ml min: pre-dose level 30 minutes before the 3rd dose
   - CrCl < 60 ml min: pre-dose level 30 minutes before 2nd dose

Target

- Trough < 2.3 mg/L (undetectable)

Amikacin traditional dosing for infections due to gram negative bacteria

Dose (Note: round dose to nearest 50mg increment)

CrCl ≥ 20ml/min	5 - 7.5 mg/kg
CrCl < 20 ml/min	5 mg/kg load, then dose by level
IHD	5 – 7.5 mg/kg post-IHD
PD	5 - 7.5 mg/kg (if using for PD peritonitis, see nephrology PD guideline)
CRRT	Suggest extended interval dosing
SLED	7.5 mg/kg For durations of SLED longer than 8-12h, consider extended interval dosing.

Frequency

- CrCl > 60 ml/min: q8h
- CrCl 40 - 59 ml/min: q12h
- CrCl 20-39 ml/min: q24h
- CrCl <20 ml/min: dose by level

Dialysis

- IHD: post-IHD (after initial load, dose by level)
- PD: dose by level
- CRRT: suggest extended interval dosing
- SLED: generally, q24h (see dosing)

Monitoring

Most patients using empiric therapy for the coverage of multi-drug resistant gram-negative infections do not require therapeutic drug monitoring (TDM) as therapy will be discontinued within 72 hours. If therapy is to continue longer than 72 hours, TDM should be done, informed consent obtained and neurotology consultation obtained.

1. **Serum creatinine** at baseline and three times weekly while on therapy
2. **TDM**
   - CrCl > 60 ml/min: peak post-3rd dose, trough pre-4th dose
   - CrCl 20 – 59 ml/min: peak post 2nd dose, trough pre-3rd dose
   - CrCl <20 ml/min: level should generally be drawn before each dose

Dialysis

- IHD: trough pre-IHD before next IHD session
- PD: peak after 2nd dose, trough before each dose
- CRRT: peak after 2nd dose, trough pre-3rd dose
- SLED: peak after 2nd dose, trough pre-3rd dose

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

Target (non-IHD)

- Pneumonia: Peak 20-30 mg/L Trough 4-8 mg/L
- Other infections: Peak 20-25 mg/L, Trough 4-8 mg/L
- Cystitis: Peak 15-20 mg/L, Trough 4-8 mg/L

Target (IHD)

- Pre-dialysis levels should be tailored to the severity of infection and should generally be between 4-8 mg/L
- Post-dialysis levels are not typically done

Amikacin for treatment of non-tuberculous *Mycobacterium spp.*

What you need to do...

1. **Determine dosing weight**

If patient is:	Then use:
Less than ideal body weight	Total (Actual) Body Weight (TBW)
100 to 130% of ideal body weight	Ideal body weight (IBW)
>130% of ideal body weight	Adjusted body weight (AdjBW) AdjBW=IBW + 0.4(TBW – IBW)

2. **Choose a dosing strategy**
   a. Traditional (daily) dosing
   b. Three times weekly dosing

Amikacin traditional (daily) dosing for treatment of non-*tuberculous Mycobacterium spp.*

(Note: management of mycobacterial disease is complex, required combination therapy with multiple antimicrobials and skill/experience in the area. Expert consultation strongly advised.)

Dose (Note: round dose to nearest 50mg increment)

- 8-15 mg/kg

Frequency

- CrCl > 60 ml/min: q24h
- CrCl 40 - 59 ml/min: q24-48h
- CrCL 30 - 39 ml/min/CRRT/SLED: q48-72h
- CrCl <30 ml/min/IHD: dose by level

Monitoring

As patients will be receiving protracted therapy, therapeutic drug monitoring (TDM) is warranted in all patients. Informed consent should be obtained and neurotology consultation obtained.

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

1. **Serum Creatinine**: baseline, then three times weekly while in hospital
2. **TDM**
   - Peak after 1st dose
   - Trough before 2nd dose
   - Repeat trough weekly or with renal function c hanges while in hospital

Target

- Peak: 20-35 mg/L
- Trough: < 2.3 mg/L (undetectable)

Amikacin <u>three times weekly dosing</u> for treatment of non-*tuberculous Mycobacterium spp.*

(Note: management of mycobacterial disease is complex, required combination therapy with multiple antimicrobials and skill/experience in the area. Expert consultation strongly advised.)

Dose (Note: round dose to nearest 50mg increment)

- 8-15 mg/kg

Frequency

- CrCl ≥ 30 ml/min: three times weekly
- CrCl < 30 ml/min, any dialysis modality: dose by level

Monitoring

As patients will be receiving protracted therapy, therapeutic drug monitoring (TDM) is warranted, Informed consent should be obtained and neurotology consultation obtained.

1. **Serum Creatinine:** baseline, then three times weekly while in hospital
2. **TDM**
   - Peak after 1st dose
   - Trough before 2nd dose
   - Repeat trough weekly or with renal function changes while in hospital

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

Target

- Peak: 20-35 mg/L (may consider higher levels in select patients)
- Trough: < 2.3 mg/L (undetectable)

Gentamicin synergy for gram positive bacteria

What you need to do…

1. Determine dosing weight

If patient is:	Then use:
Less than ideal body weight	Total (Actual) Body Weight (TBW)
100 to 130% of ideal body weight	Ideal body weight (IBW)
>130% of ideal body weight	Adjusted body weight (AdjBW) AdjBW=IBW + 0.4(TBW – IBW)

2. Confirm indication for therapy

a. Streptococcus spp. infective endocarditis
b. Enterococcus/Staphylococcus spp. infective endocarditis

Gentamicin synergy for *Streptococcus spp.* infective endocarditis

Dose and Frequency (Note: round dose to nearest 20mg increment)

CrCl	Dose and Frequency
>60 ml/min	3 mg/kg q24h
40 – 59 ml/min	1 mg/kg q12h
20 – 39 ml/min	1 mg/kg q24h
<20 ml/min	1 mg/kg (dose by level)
Dialysis	
IHD	1 mg/kg post-IHD (dialysis days only)
PD	1 mg/kg q48h (dose by level)
CRRT	1 mg/kg q24h
SLED	1 mg/kg q12-24h (SLED duration dependent)

Monitoring: As patients will be receiving protracted therapy, therapeutic drug monitoring (TDM) is warranted in all patients. Informed consent should be obtained and neurotology consultation obtained.

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

1. **Serum Creatinine:** baseline, then three times weekly while in hospital
2. **TDM**
   - CrCl ≥ 60 ml/min: trough ONLY, before 3rd dose
   - CrCl 20 – 59 ml/min/SLED/CRRT: peak post 2nd dose, trough pre-3rd dose
   - CrCl <20 ml/min/PD/IHD: Peak post 2nd dose. Trough levels should generally be drawn 24 hours after first dose. Re-dose when level less than 1 mg/L.

Target

- Peak: 3-4 mg/L (not for use with 3mg/kg q24h dosing)
- Trough: < 1 (undetectable preferred if using 3 mg/kg q24h)

Gentamicin synergy for *Staphylococcus/Enterococcus spp.* infective endocarditis

Dose and Frequency (Note: round dose to nearest 20mg increment)

CrCl	Dose and Frequency
>60 ml/min	1 mg/kg q8h
40 – 59 ml/min	1 mg/kg q12h
20 – 39 ml/min	1 mg/kg q24h
<20 ml/min	1 mg/kg (dose by level)
Dialysis	
IHD	1 mg/kg post-IHD (dialysis days only)
PD	1 mg/kg q48h (dose by level)
CRRT	1 mg/kg q24h
SLED	1 mg/kg q12-24h

Monitoring: As patients will be receiving protracted therapy, therapeutic drug monitoring (TDM) is warranted in all patients. Informed consent should be obtained and neurotology consultation obtained.

1. **Serum Creatinine:** baseline, then three times weekly while in hospital
2. **TDM**

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

- CrCl ≥ 60 ml/min: peak after 3rd dose, trough before 4th dose
- CrCl 20 – 59 ml/min/CRRT/SLED: peak post 2nd dose, trough pre-3rd dose
- CrCl <20 ml/min/PD/IHD: Peak post 2nd dose. Trough levels should generally be drawn 24 hours after first dose. Re-dose when level less than 1 mg/L

Target

- Peak: 3 – 4 mg/L
- Trough: < 1 mg/L

Aminoglycoside Dosing in Patients with Cystic Fibrosis

Management of pulmonary infection in patients with cystic fibrosis is complicated by altered aminoglycoside pharmacokinetics and by antimicrobial resistance. As patients with cystic fibrosis have likely been exposed to a number of antimicrobials, including aminoglycosides, careful assessment of antimicrobial resistance and consultation with clinicians experienced in the management of infections in cystic fibrosis is strongly suggested.

Historically, aminoglycosides have been dosed with a traditional dosing method to overcome the increased clearance present in patients with cystic fibrosis. More recent literature has suggested an extended daily dosing/"once daily" dosing approach may be effective and more convenient.

If unable to use extended interval dosing, consult infectious diseases and/or clinical pharmacists.

Of note, inhaled aminoglycoside therapy is not covered in this document.

Dose

- Tobramycin/Gentamicin: 10 mg/kg
  (Note: round to nearest 20mg increment)
- Amikacin: 30-35 mg/kg
  (Note: round to nearest 50mg increment)

Frequency

- CrCl > 60 ml/min: q24h
- CrCl 40-59 ml/min: q36h
- CrCl 20-39 ml/min, SLED and CRRT: q48h (adjust dose by level)
- CrCl <20 ml/min: adjust dose by level
- IHD/PD: consult infectious disease/clinical pharmacist

Monitoring

If therapy is to continue longer than 72 hours, therapeutic drug monitoring (TDM) should be done, informed consent obtained and neurotology consultation obtained.

Peak Level Timing: 30 minutes AFTER then end of the infusion

Trough Level Timing: <30 minutes BEFORE next dose

Lastly, as drug clearance may be higher than anticipated given a degree of renal dysfunction, peak levels should be considered with full pharmacokinetic assessment performed.

1. ***Serum creatinine*** at baseline and three times weekly while on therapy
2. **TDM**
   - CrCl ≥ 60 ml/min: pre-dose level 30 minutes before the 3rd dose
   - CrCl < 60 ml min: pre-dose level 30 minutes before 2nd dose

Target

- Amikacin: <2.3 mg/L (undetectable)
- Tobramycin/Gentamicin: <1 (preferably undetectable)

Aminoglycoside Safety Information for Discussion with Patients and Caregivers

Disclaimer: this information sheet is meant to serve as a reference to guide an informed consent discussion. It is not a standalone informed consent document

- Aminoglycoside are a group of antimicrobials that include gentamicin, tobramycin and amikacin
- Aminoglycosides are antimicrobial agents used to help treat infections that are often resistant to other antimicrobial agents
- Although used for many years, aminoglycosides may have serious adverse effects
- Aminoglycosides can cause damage to the kidneys (nephrotoxicity) and to the hearing and balance systems of the body (ototoxicity, cochleotoxicity or vestibulotoxicity)
- Ototoxicity can occur in up to 20-40% of patients receiving long-term aminoglycoside therapy and may be irreversible. The risk increases with duration of use.
- Nephrotoxicity occurs in 5-15% of patients receiving aminoglycosides and is usually reversible after stopping drug therapy.
- To help reduce the risk of some of these side effects, your clinical team will monitor your renal function and drug levels of aminoglycosides
- In addition, if you need longer therapy with aminoglycosides, you may need to receive assessment from special hearing and balance clinicians
- While on aminoglycoside therapy, report any hearing changes, balance changes or changes to your gait (the way you walk) immediately
